Sustainability & Environmental statement

The scarcity of resources and need to reduce global environmental impact is placing a greater emphasis on resource efficiency within the construction industry, making light gauge steel profiles the product of choice.

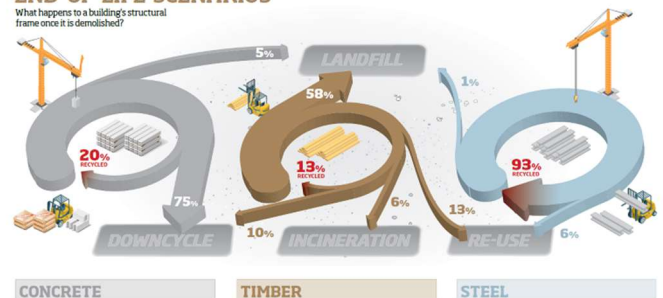

Steel is 100% recyclable and European manufacturing already contains up to 55% recycled content. The reuse of scrap steel saves up to 70% energy needed to manufacture from virgin materials, without loss of quality or strength. Over 500 million tonnes of steel are recovered and recycled annually worldwide. Continuing development by major steel producers will reduce the environmental impact further over the coming years, and importantly steel recycling is financially viable and environmentally friendly.

ESP are committed to the manufacture and design of products in the most efficient way, offering project solutions that are sustainable and cost efficient solutions.

Recycling in construction

END-OF-LIFE SCENARIOS

What happens to a building's structural frame once it is demolished?

When Bespoke is best.

ESP offer our range of drywall and SFS studs, manufactured to length, reducing waste on site, and saving man hours. An environmental and money saving solution.

The ESP Drywall range is manufactured to EN 14195

European Steel Profiles Ltd, Unit 1F, The Ridgeway, Iver Bucks, SL0 9JQ
